

Electric Vehicles

[Back to Wireless Power Transmission](#)

An electric vehicle (EV), also referred to as an electric drive vehicle, uses one or more electric motors or traction motors for propulsion. Electric vehicles include electric cars, electric trains, electric lorries, electric airplanes, electric boats, electric motorcycles and scooters and electric spacecraft.

Electric vehicles first came into existence in the mid-19th century, when electricity was among the preferred methods for motor vehicle propulsion, providing a level of comfort and ease of operation that could not be achieved by the gasoline cars of the time. During the last few decades, environmental impact of the petroleum-based transportation infrastructure, along with the peak oil, has led to renewed interest in an electric transportation infrastructure.

Electric vehicles (EVs) are propelled by an electric motor (or motors) powered by rechargeable battery packs. Electric motors have several advantages over internal combustion engines (ICEs):

- **Energy efficient.** Electric motors convert 75% of the chemical energy from the batteries to power the wheels?internal combustion engines (ICEs) only convert 20% of the energy stored in gasoline.
- **Environmentally friendly.** EVs emit no tailpipe pollutants, although the power plant producing the electricity may emit them. Electricity from nuclear-, hydro-, solar-, or wind-powered plants causes no air pollutants.
- **Performance benefits.** Electric motors provide quiet, smooth operation and stronger acceleration and require less maintenance than ICEs.
- **Reduce energy dependence.** Electricity is a domestic energy source.

Status of EV Market

California created regulations specifying a share of electric vehicles to be sold in California to be 10% after GM announced its intention to produce Electric Vehicles, in 1990. Several manufacturers produced and field tested several EVs, predominantly using Nickel Metal Hydride (NiMH). Moreover, as a result of the sharp rise in oil prices, and considerable technological progress in lithium ion (Li-ion) battery chemistries, a new wave of enthusiasm for electric vehicles (EVs) has emerged. Santini and Vyas (2009) for the U.S. and Golob and Brownstone (2005) for California have shown that the proportion of cars in the vehicle population increases as population density increases. Thus, EVs that are under development are ?City? cars, or ?City EVs?. They are generally small, even among cars.

Major EVs in the Market

- BMW is developing an EV version of its Mini, which becomes a two-seater when the battery is included.
- DaimlerChrysler is developing an electric version of the ?ForTwo?, a small two-seater now available in the U.S.
- Mitsubishi has developed the i-MiEV, a ?Lilliputian four passenger EV with 16 kWh battery packs that may be priced at upwards of \$45000?.
- Mitsubishi plans more models and will have a cooperative agreement with Peugeot of France to produce EVs for Peugeot.
- Tesla Motors, which has developed the extremely high performance two seat electric Tesla Roadster, plans to produce a sedan seating 5 adults and two small children, the Model S. Tesla has sold 700 roadsters, which use Li-ion batteries, at prices above \$100,000.
- The all-electric car, Leaf by Nissan Motors, having four doors and a hatchback, which was launched in US IN 2010. It is recommended that consumers have a home charging station, made by Aerovironment, installed for an average cost of \$2,200, according to Nissan. The all-electric Leaf has a driving range of about 100 miles
- General Motors designed the Chevy Volt with a large battery pack and a gasoline engine. It was also launched in 2010. Thus, unlike the Leaf the Volt has a gas engine to fall back on. It generates power to spin the electric motor when the battery is depleted.

- Toyota introduced its first hybrid gas-electric vehicle, Prius, in 2000. In January 2011, Toyota debuted the Prius v, which goes on sale in third quarter of 2011. It is a mid-size vehicle that provides more than 50 percent additional interior cargo space than the current Prius. In early 2012 Prius will launch two more Prius family members ? the Prius c compact hybrid vehicle and the Prius Plug-in Hybrid vehicle.
- Ford joins GM, Nissan and Toyota in mass-producing plug-in cars. In January 2011, Ford unveiled electric Ford Focus. Ford's electric car has no gasoline engine for backup. It can drive from 80 to 100 miles on a full charge. The car even communicates with smart phones, so a driver can call his car remotely and order it to charge immediately, or wait for utility rates to drop at nighttime. Ford is also planning new electric, hybrid and plug-in vehicles by 2015.

Company	PHEV	BEV	Models	Timeline	Planned Production Output
BMW	No	Yes	Mini-E, Active-E, Megacity	Megacity-2013 Mini-E, Active-E on pilot lease	Unknown
Chrysler-Fiat	No	Yes	Fiat 500	2012	Unknown
Daimler	No	Yes	Smart ED Fortwo	2012	1,500 globally in 2011, series production in 2012
Mitsubishi	Yes	Yes	iMiEV, PX-MiEV	i-MiEV: 2011 PX-MiEV: 2013	Unknown
Tesla	No	Yes	Roadster, Model S	Roadster: in serial production Model S: 2012	Roadster: 1,200 annually Model S: 20,000 annually
Nissan	No	Yes	LEAF, NV200, Infiniti EV	LEAF: In serial production	LEAF: 500,000/year globally by 2012
GM	Yes	No	Volt	In serial production	2011: 10-15,000 units 2012: up to 60,000 units
Ford	Yes	Yes	Focus BEV, Transit Connect Electric, unnamed PHEV	Transit Connect Electric: began in late 2010 Focus BEV: 2011 Unnamed PHEV: 2012	Transit Connect Electric: 600-700 annually beginning in April 2011 Focus BEV: 5,000-10,000 units annually ¹³
Toyota	Yes	Yes	Prius PHEV, Unnamed BEV	2012	Prius PHEV: 10000 units annually
