- Perform a landscape search in the area of Artificial Retina
- Use PCS to derive insights and gain competitive perspective
- Understand the value chain and recent M&A activities

Introduction

The retina is the third and inner coat of the eye, which is a light-sensitive layer of tissue. The optics of the eye creates an image of the visual world on the retina (through the cornea and lens). Normal vision begins when light enters and moves through the eye to strike specialized photoreceptor cells in the retina called rods and cones. These cells convert light signals to electric impulses that are sent to the optic nerve and the brain.

At least two significant forms of blindness occur because of a loss of the photoreceptive cells of the retina, namely:

- Age-related macular degeneration - results in a loss of central vision, which eliminates a person's ability to read or recognize faces
- Retinitis pigmentosa - results in a slow loss of peripheral and then central vision

With the artificial retina device, a miniature camera mounted in eyeglasses captures images and wirelessly sends the information to a microprocessor (worn on a belt) that converts the data to an electronic signal and transmits it to a receiver on the eye. The receiver sends the signals through a tiny, thin cable to the microelectrode array, stimulating it to emit pulses. The artificial retina device thus bypasses defunct photoreceptor cells and transmits electrical signals directly to the retina's remaining viable cells. The pulses travel to the optic nerve and, ultimately, to the brain, which perceives patterns of light and dark spots corresponding to the electrodes stimulated. Patients learn to interpret these visual patterns. [Artificial Retina Project](#)

Search in PCS

Description

FIELD OF THE INVENTION

0001 [0001] The present invention is generally directed to medical devices. More particularly, the present invention is directed to an **artificial retina** medical device and method to more efficiently **stimulate** electrically and with higher resolution, neuroretinal cells in partially damaged **retinas** to produce **artificial vision**. The invention provides improved efficiency and resolution of the device by using transretinal electrical current **stimulation** provided by **stimulation** and ground return **electrodes** that are disposed on opposite sides of the neuroretina.

Claims

1. An **artificial retina** device to electrically **stimulate** **artificial vision**, the **artificial retina** device comprising: a **stimulating** electrode connected with the electrical source; and a ground return electrode connected with the electrical source, wherein the **stimulating** electrode and the ground return electrode are configured to be disposed with respect to the neuroretina.
2. The device of claim 1 wherein the **stimulating** electrode and the ground return electrode are disposed on opposite sides of the neuroretina.
3. The device of claim 2 wherein the **stimulating** electrode and the ground return electrode are disposed on opposite sides of the neuroretina.

Top Assignees

- The top companies under top 5 that are big players in Artificial vision devices from North America:
 - ◆ Second Sight Medical Products ? California
 - ◆ Optobionics Corporation ? Illinois
- The top two companies that are big players in Artificial vision devices from Europe:
 - ◆ Pixium Vision - France
 - ◆ Retina Implant AG - Germany
- Three major universities in US, that have also patented technologies in this space:
 - ◆ John Hopkins University
 - ◆ California Institute of Technology
 - ◆ Cornell University

Top Assignee- Insights

(A) Second Sight Medical Products Inc.

- They have patents that focus on improving the user comfort and user feedback.

- **A61B** ---> DIAGNOSIS; SURGERY; IDENTIFICATION

IP Activity

- IP activity started 20 years and saw a peak in the number of publications in 2008, followed by 2012 and 2015.
- The number of applications shot to the peak value during the period of 2006-2007.

Geographical Distribution

- Most of the patents in this technology are from US or Europe.
- Japan and China top the Asian subcontinent, in the number of patent filings.
