Introduction

Fig.1. Cheese Analogue

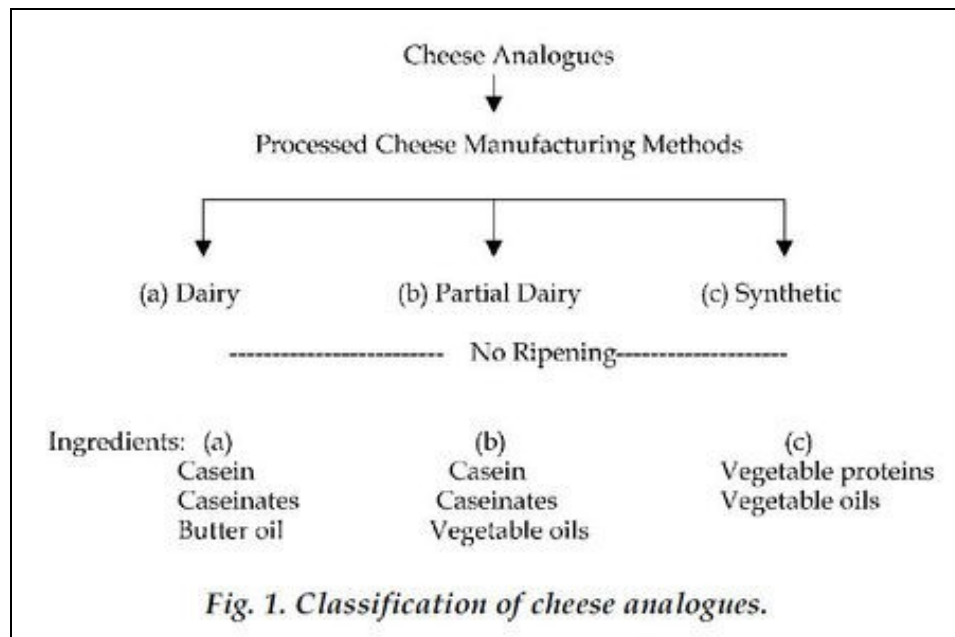

Cheese is widely used as one of the preferential ingredient in fast foods and readymade conventional meals. However, high costs associated with natural cheese production and storage has prompted industry to search for alternatives. Attempts to reduce cheese cost have led to the development of cheese substitute called cheese analogues (Mounsey & Oriordan, 2001). Cheese analogues are usually defined as products made by blending individual constituents, to produce a cheese-like product to meet specific requirements. In cheese analogues, milk protein and milk fats are partially or wholly replaced with vegetable proteins and vegetable fats and oils. Cheese analogue are formulated and produced with desired nutritional, functional and storage properties as per the market and consumer needs.

Sales of cheese analogues are closely linked to developments in the convenience food sector (H.P. Bachmann, 2001). Cheese analogs are being used increasingly due to

- - ◆ Cost effectiveness (due to low cost of vegetable oils compared with butter fat)
 - ◆ Simplicity of their manufacture (no maturation)
 - ◆ Can be tailor made
 - ◆ Offer diverse functionality range (e.g. flowability, melt resistance, shredability, etc)
 - ◆ Improved shelf life and exhibits high functional stability during storage
 - ◆ Consistent in quality without seasonal variations

Classification of cheese analogues

Cheese analogs are categorized into three categories as dairy, partial dairy or non dairy, depending upon whether the fat and or protein components are from dairy or vegetable sources (Rupesh & Jana, 2007).

Product and process of producing a no-fat cheese analog containing rennet casein
Priority Date (y-m-d): 1992-04-28
First Inventor: Rybinski, Barbara E.
US Class (primary): 426582
IPC Class (primary): A23C001909

Abstract:
 A no-fat cheese analog having the texture, body and eating qualities of cheese is produced by admixing about 15% to about 35% of a coagulated skim milk product having a fat content of less than 2%, about 15% to about 35% dry particulate rennet casein, about 1% to about 3% of an edible emulsifying salt, sufficient quantities of flavoring agents and acidulants to impart desired flavor and pH, and about 30% to about 65% water; said dry rennet casein being hydrated in said

Claims:
 1. A no-fat cheese analog having the texture, body and eating qualities of cheese and a total fat content of less than 0.5% comprising admixing about 15% to about 35% of a coagulated skim milk product having a fat content of less than 2%, about 15% to about 35% dry particulate rennet casein, about 1% to about 3% of an edible emulsifying salt, sufficient quantities of flavoring agents and acidulants to impart desired flavor and pH, and about 30% to about 65% water; said dry rennet casein being hydrated in said water by action of said emulsifying salt at temperatures of about 160° F. to about 200° F. under agitation conditions for a time period sufficient to provide a plastic homogenous body being substantially free of unhydrated rennet casein particles, said edible emulsifying salt being present at about 2% to about 15% by weight of the said particulate rennet casein, said emulsifying salt being selected from the group consisting of alkali metal phosphates, citrate salts and mixtures thereof.
 2. The cheese analog of claim 1 wherein the coagulated skim milk product is selected from the group consisting of baker's cheese, cottage cheese, yogurt, quarg, ymer, pot cheese, and
